

Final Project Proposal

Brian Shin

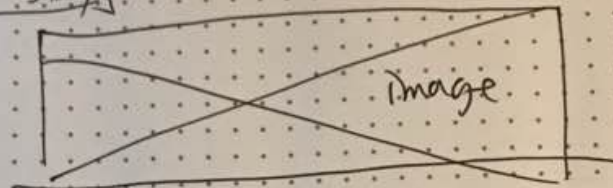

My final project for the class will be a re-design of a website for a family member's business. The website has been built a long time ago and the contents haven't been updated a while so this will be a complete revamp. I will continue to work with the site owners to build a site that fits their needs and enables me to use as much knowledge as I can from this class. The site URL is: <http://www.kingsasian.com/index.html>

The plan for now is to build this as a single page website with more concise content that is presented in a way that is easy for people to skim through and digest. The site currently has several menus and pages within and is tailored to old standards. The fonts are small and images are outdated, which makes it hard for users to consume the information or watch it on different platforms like mobile or tablets.

This is a basic re-design of the layout based on what is on the site currently. I'm not sure what effects/specs I will add since we just started to learn those. I also want to make this mobile-friendly.
