

Final Project Wireframe

My final project website is going to be my portfolio website. My initial plan is to have a single page website and eventually as my projects increase I will add links to the websites I create. The initial appearance of the page would be a huge banner with my name and some navigation links at the top right. After the scroll the page will lead to the part where I will mention my skills and the programs I am able to use efficiently. The third part of the scroll would include a collage of my projects. Since this is the initial project, it will only have 1 or 2 mentions but with time I plan to add more projects to the gallery with external links to the sites. And finally, the last section of the website would include how to contact with me as well as links to my linkedin and github.

I am interested in making it responsive and interactive. I am still researching the ways to make it more interactive. As we learn JavaScript more I am sure it will get clearer. I plan on implementing a minimalistic design as the trends nowadays is to have clean and minimal but informational website.
